Making Healthcare Smarter

www.logicnets.com

Thank you for visiting our booth at HIMSS22. Here's a take-away of what LogicNets offers.

Why LogicNets?

Clinicians and practitioners can't be experts in every area and are constantly challenged by the rapid progress of studies and evolution of new knowledge. To provide guidance, organizations are augmenting their workflow infrastructure to provide next generation tools for reinforcing informed decisioning. LogicNets is a strategic platform to help organizations give clinicians immediate access from the workflow to guidance and supporting information for: diagnoses and treatments, appropriate use validation for medications and procedures, structured reporting, screening and assessments, patient care management, and much more.
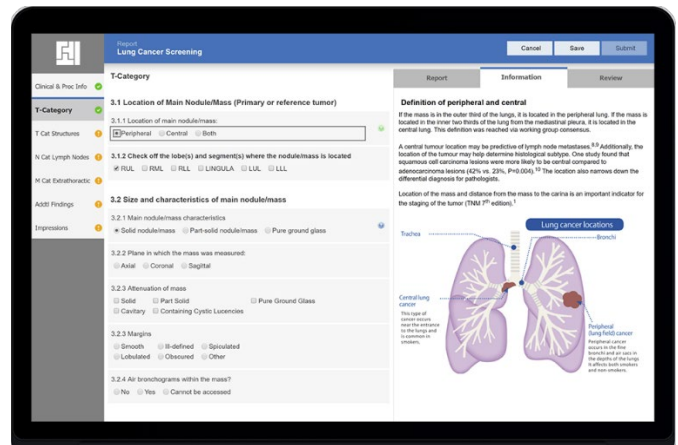

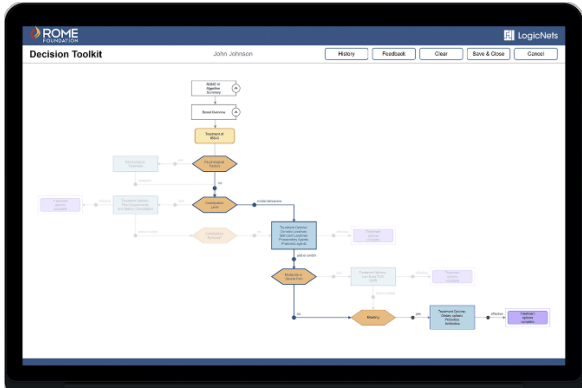

LogicNets Solutions

Appropriate Use

Get ready! On January 1, 2023 all providers in the US will be required by CMS under the Protecting Access to Medicare Act of 2014 (PAMA) to ensure that radiology orders have been validated electronically through the use of an electronic clinical decision support mechanism (CDSM). LogicNets is a CMS-qualified CDSM provider. We have partnered with qualified provider-led entities (qPLEs) authorized by CMS to provide the mandatory clinical guidelines under PAMA. Our powerful Clinical Decision Support platform allows Providers, PLEs and EMR vendors to develop robust appropriate use validation capabilities and comply with the new requirements.

Structured Reporting

From clinical procedures to population health research, collecting complete and accurate information is vital. LogicNets lets you create intelligent and dynamic voice-enabled structured reporting applications to guarantee proper support of patient care and research. Clinicians in pathology, radiology, oncology, and other areas deploy LogicNets reporting applications to improve user productivity while ensuring clinical quality and meeting the data objectives of population health research. LogicNets reports support each clinician's way of working. The system dynamically computes results, presents them on-screen, and structured output to feed downstream workflow and systems.

Easy Integration for Vendors

With LogicNets' progressive use of web services, EHR and other clinical software vendors can rapidly and easily integrate and incorporate LogicNets guidance into the workflow. Patient data can be dynamically and securely accessed by your LogicNets applications and be used to drive decision processing. The results from LogicNets CDS guidance can then be returned to the EHR or electronically distributed in virtually any format for downstream workflow processing.

Clinical Decision Support

Clinical decision support (CDS) has long offered great promise for improving healthcare by giving practitioners on-demand, easy-to-consume access to diagnostic/treatment and managed care protocols from within the workflow. LogicNets is a next-generation CDS platform that overcomes the historical shortcomings around workflow integration and intelligent interactive behavior that have limited CDS adoption. Medical knowledge organizations, professional societies, and providers from all medical fields use LogicNets to directly capture and deliver their special areas of evidence- and consensus-backed knowledge as a vital on-demand resource within the workflow. Clinicians trust our graphical representation of algorithms and care pathways because it allows them to quickly see and review all scenarios without laborious data entry or processing of dense reference material.

It was a pleasure to meet you at HIMSS22. Please reach out and contact us:
